

1.Dialog validation ensures that authors enter valid values before saving content in the AEM dialog.

How to use it?

You can set the required="{Boolean}true" property in dialog fields to make them mandatory.

Custom Validation:

If you need custom validation (e.g., restrict date of birth to be in the past), use JavaScript validation.

2.What is ClientLib?

AEM ClientLibs (Client Libraries) allow developers to manage JavaScript and CSS in a structured way.

They are stored under /apps/<project>/clientlibs/

Helps to manage dependencies, minification, and caching.

3. What is extraClientLibs & How to Create Custom?

extraClientLibs is used to load additional client libraries dynamically.

You can add extra client libraries in your component's cq:dialog.
